The present invention relates to non-parenteral multi-particulate formulations for transporting agents (for example therapeutic) across mucosal membranes. The formulations comprise carrier particles bound with a biologically active agent and a penetration enhancer. The formulations associate with buccal, nasal, pulmonary, gastrointestinal and vaginal mucosal membranes to transport the biologically active agents to the lymph system, blood system or epithelial tissue of the subject. The formulation is administered orally which is preferred by patients. The present sequence is an example oligonucleotide that may be used in the
                                                                                                                                                                                                                                                                                                       Non-parenteral multi-particulate formulations comprise biologically active substances bound to carrier particles for delivery across mucosal

This invention describes a novel conjugate (1) which consists of (A) a molecule to be transported and (B) at least one aryl residue of formula - Ar (X-(X)-R_1) n (II). Ar = group containing at least one aromatic ring; X = O or N (sic); Y = O; NH-R_2 (sic); R_1 = optionally substituted 1-18C alkyl (optionally containing double and/or triple bonds); n = integer of l or more. (A) is bonded to (B) directly or triple bonds; n = integer of l or more. (A) is bonded to (B) directly or via a chemical group, provided that the chemical group is other than CH_2 cf. if the bond is via a phosphodiester linkage of (A). The invention also describes (i) the preparation of a conjugate (I') of (A') a molecule to be transported and (B') at least one aryl residue (not restricted to comparation of a conjugate (I') of (A') a molecule to comparating (B') and reacting (B') and reacting (B') and (ii) the use of aryl groups (II) (optionally bonded via a chemical comparation of a caross biological membranes. The products of the invention have cytostatic, virucide, vasotropic, dernatological, aritipsoriatic and antiasthmatic activity and can be used for generation of (A) with (B) is useful for transporting (A) across biological membranes or into eukaryotic or prokaryotic cells (specifically bacterial, yeast or mammalian cells, including human cells, containing (I) are also claimed. Typically (I) are altients or containing viral infections or diseases associated with integring or cell-incorpic virialists or cell-incorp cell interactions (e.g. restenosis, vitiligo, psoriasis or asthma); or labeled oligonucleotides for in vivo diagnostic use, e.g. by in situ hybridization. Conjugation with (B) markedly improves the cellular uptake of (A), e.g. in tumor cells. (B) include fluorescein derivative residues, in which case the conjugates (I) are fluorescently labeled, allowing microscopic monitoring of cellular uptake etc. The cellular uptake of (I) is superior to that obtained using other conjugated groups related to (II); e.g. oligonucleotides conjugated with fluorescein diacetate (within the scope of (B)) have superior uptake to corresponding fluorescein Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds. Gaps New substituted aryl conjugates of parent molecules, especially oligonuclectides, having improved transmembrane and intracellular transport properties, useful as medicaments or diagnostic agents. . 0 0.9%; Score 15.2; DB 1; Length 21; 35.0%; Pred. The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.
                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and

disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various oblymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart

                                                                                                                                                                                                                                                               ö
                                                                                                                                                                      The present invention relates to a method for preparing phosphorothioate oligonucleotides having at least one nucleoside with a 2' modification. The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid group having at least one nucleoside with a 2' modification in an acetonitrile. The present sequence was used to illustrate the method of the present invention. The method is useful for synthesising sulphurised 2' substituted phosphorothioate oligonucleotides, which may be used in molecular biological research, in applications such as anti-viral therapy, and for determining the stereochemical pathways of certain
                                                                                                                 Preparing sulfurized 2' substituted phosphorothioate oligonucleotides useful in biological research, comprises phosphitylating the 5'-hydroxyl of a nucleic acid having a nucleoside with a 2' modification.

                                                                                                                                                          The present invention provides novel compositions comprising phosphoramidite compounds which can be used to synthesise modified oligonucleotides have phosphorothioate backbones. They can be used to produce probes, primers, linkers, adaptors and gene fragments and in disease diagnosis and therapy, for example in the treatment of AIDS and atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide nucleic acid derivatives, useful e.g. for tumor treatment and diagnosis, contain terminal, deprotonizable phosphoryl groups for e.g. improved solubility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= a

The present invention relates to peptide nucleic acid (PNA) derivatives having at the C-, and optionally N-, terminus one or more phosphoryl groups, at least one of which contains one or more deprotonisable groups, preferably hydroxy or mercapto. These PNAs are useful in the treatment of tumours or any disease associated with (over) expression of particular genes, including viral infections, vitiligo or other pigmentation disorders, and asthma. The present sequence is a peptide nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to peptide nucleic acid (PNA) derivatives. These can be used in the treatment of cancer, viral infections, vitiligo or other pigmentation disorders, and asthma. The present sequence is an oligonucleotide fragment of a PNA described in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptide nucleic acid derivatives, useful e.g. for treating tumors and diagnosis, have N-terminal phosphoryl residue for improving e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide nucleic acid; PNA; polyamide backbone; phosphoryl radical; cytostatic; virucide; dermatological; antiasthmatic; cancer; antisense; viral infection; vitiligo; pigmentation disorder; asthma; ss.

The complex is useful for detecting HCV replicase activity and permits establishment of sensitive RNA-dependent RNA polymerase assays to screen and evaluate antiviral inhibitors and to improve the specificity and efficacy of the inhibitors. The complex is also useful in the development of a reliable system for determining kinetic and thermodynamic constants of HCV MSSB-catalysed nucleotide incorporation or chain termination. Specifically, the short RNA template and primer pairs are useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel replicase complex comprising hepatitis C virus NSSB replicase, a 3 nucleotide-long template to which a 2 nucleotide-long primer is annealed, and template and primer which do not form a stable duplex in the absence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               screening assays which are used for determining kinetic, thermodynamic and mechanistic properties of NS5B replication and ultimately in the development of inhibitors of NS5B. Newly identified inhibitors of replicase activity may be used for developing anti-HCV pharmaceuticals. Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                          Hepatitis C virus (HCV) NS5B replicase RNA synthesis template #25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..

The present sequence is that of antisense oligomucleotide (ODN) 5114

(Formiversen 13312 ISIS), which was used in an example of the invention in which methylated CpG-like oligomucleotides were compared with unmethylated ODNs for their immunostimulant activity. ODN 5114 exhibited significant stimulatory capability on human B cells, and its corresponding methylated form, ODN 5154 (see ABV73595) also induced stimulation, although to a lesser extent. Methylated CpG, CpI and ZpY ODNs of the invention (see ABV73935.37) are useful for inducing an immune response in a subject, including humans, for the treatment or prevention of an infectious disease, cancer, allergy or asthma, for enhancing or stimulating bone marrow proliferation in an immunodeficiency, particularly in a subject undergoing chemotherapy, for enhancing crythropoiesis in anaemia, for enhancing thrombopoiesis in thrombocytopaenia, for enhancing neutrophil proliferation in neutropaenia, and for inducing cytokine (e.g. interleukin (IL)-1 beta, IL neutropaenia, and for inducing cytokine (e.g. interleukin (IL)-1 beta, IL continued of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          useful for treating or preventing infectious diseases, cancer, allergy, asthma, immunodeficiency, anemia, thrombocytopenia or neutropenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New compositions comprising CpG-like immunostimulatory nucleic acids, useful for treating or presenting factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

immunodeficiency, particularly in a subject undergoing chemotherapy, for enhancing erythropoiesis in anaemia, for enhancing thrombopoiesis in thrombocytopaemia, for enhancing neutrophil proliferation in neutropaemia, and for inducing cytokine (e.g. interleukin (IL)-1 beta, IL p. (1L-12, IL-18, TNF, interferon-alpha or interferon-gamma)

```
The present sequence is that of methylated oligonucleotide (ODN) 5154, a methylated version of antisense ODN 5114 (see ABV73946), which was used in an example of the invention in which methylated Cp6-like ODNs were compared with unmethylated ODNs for their immunostimulant activity. ODN 5114 exhibited significant stimulatory capability on human B cells. ODN 5154 also induced stimulation, although to a lesser extent. Methylated CpG, CpI and ZpY ODNs of the invention (see ABV73935-7) are useful for inducing an immune response in a subject, including humans, for the treatment or prevention of an infectious disease, cancer, allergy or asthma, for enhancing or stimulating bone marrow proliferation in an analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New compositions comprising CpG-like immunostimulatory nucleic acids, useful for treating or preventing infectious diseases, cancer, allergy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              asthma, immunodeficiency, anemia, thrombocytopenia or neutropenia.

encoding a human protein kinase C (PKC) isoform (i.e. PKC-alpha, PKC-beta type I, PKC-beta type II, PKC-gamma, PKC-delta, PKC-epsilon, PKC-zeta, than antisense oligonucleotides of the invention are useful for modulating the expression of the PKC isoforms. The antisense oligonucleotides are useful for treating hyperproliferative conditions (e.g. tumour, glioblastoma, bladder cancer, breast cancer, colon cancer and lung cancer), and inflammatory conditions (e.g. psoriasis). The antisense oligonucleotides of the invention are also useful for detection and diagnosis of PKC expression. The present sequence represents an antisense oligonucleotide described in the invention. NOTE: The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New human colocarcinoma-originated G protein-coupled receptor protein for developing drugs e.g. with transgenic animals to treat diseases of the central nervous system, endocrine diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel colocarcinoma-originated G protein-coupled receptor protein. The protein and encoded DNAs are for diagnosis and developing drugs e.g. with transgenic animals to treat diseases of the central nervous system, endocrine and metabolic diseases, and cancer, including by gene therapy. ARK69599-ABK69646 represent G protein-coupled receptor protein coding sequences and related primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

New human colocarcinoma-originated G protein-coupled receptor protein for developing drugs e.g. with transgenic animals to treat diseases of the central nervous system, endocrine diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel colocarcinoma-originated G protein-coupled receptor protein. The protein and encoded DNAs are for diagnosis and developing drugs e.g. with transgenic animals to treat diseases of the central nervous system, endocrine and metabolic diseases, and cancer, including by gene therapy. ASK69599-ASK69646 represent G protein-coupled receptor protein coding sequences and related primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligomeric synthesis method, diagnostic, therapeutic, antisense agent, antiviral agent; competitive inhibitor; ss.

oligomeric compounds are useful e.g. as oligonucleotides or oligonucleotide analogues in diagnostics, therapeutics and as research agents. Oligonucleotides and their analogues have been used in molecular biology as probes, primers, linkers, adapters and gene fragments. They may also be useful as antisense agents for various disease states, e.g. antiviral agents, or as competitive inhibitors of transcription factors to modulate their action. Oligonucleotides and their analogues have also been used as direct and indirect regulators of protein, in diagnostic hybridisation techniques, and as primers in PCR reactions. This sequence represents a synthetic polymucleotide created using the oligomeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes oligomeric compounds containing a moiety. The oligomeric compounds are useful e.g. as oligomerlectides or oligomucleotide analogues in diagnostics, therapeutics and as research agents. Oligomucleotides and their analogues have been used in molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligomeric compounds containing e.g. phosphite, phosphodiester and phosphorothioate linkages, useful as oligonucleotides or analogs in diagnostics, therapeutics and as research agents.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated or substantially pure von Willebrand factor-cleaving protease (vWF-cp) polypeptide. vWF-cp is useful for purifying vWF which involves providing vWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified vWF. vWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal with vWF-cp and isolating the anti-vWF cp polypeptide antibodies from the animal. vWF-cp is useful for producing a preparation of prophylaxis and therapy of thrombosis and
biology as probes, primers, linkers, adapters and gene fragments. They may also be useful as antisense agents for various disease states, e.g. antiviral agents, or as competitive inhibitors of transcription factors to modulate their action. Oligonucleotides and their analogues have also been used as direct and indirect regulators of protein, in diagnostic hybridistation techniques, and as primers in PCR reactions. This sequence represents a synthetic polymucleotide created using the oligomeric compounds synthesis method described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated or substantially purified Von Willebrand factor-cleaving protease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, Von Willebrand factor-cleaving protease, vWF-cp, therapy; enzyme; transgenic animal; immunisation; thromboembolic disease; preeclampsia; thrombotic thrombocytic purpura; TTP, Henoch-Schonlein purpura; thrombosis; neonatal thrombosypaenia; haemolytic-uraemic syndrome; transgenic; anticoagulant; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human Von Willebrand factor-cleaving protease cloning PCR primer, 6278.

```

The invention relates to a method for amplifying a nucleic acid using Single Primer Amplification (SPA). The method comprises synthesising a template mucleic acid containing a predetermined sequence and hairpin structure with the nested oligonuclectide extension reaction. The method is useful for amplifying a nucleic acid, preferably for amplifying a family of related micleic acid sequences to build a complex library of polypeptides encoded by the sequences. The engineered nucleic acid strand by providing a nucleic sold with a predetermined sequence engineered nucleic acid strand sequence complementary to the predetermined sequence and a hairpin structure between them and contacting the engineered nucleic acid strand with a primer containing at least a portion of the predetermined sequence. This process is done in the presence of a polymerses and nucleotides under conditions suitable for polymerisation to produce a complementary nucleic acid strand. The method of the invention is useful complementary nucleic acid strand. The method of the invention is useful sequence large and polymerisation to produce a complexing simultaneously more than one different target nucleic acid sequence located on the same or different nucleic acid molecules. This polymerise process is an opigonucleotide relating to the the template for Amplifying nucleic acid by synthesizing template nucleic acid containing a predetermined sequence and hairpin structure and using target amplification by Single Primer Amplification. invention

The method is useful for preparing oligomeric compounds which are used to modulate RNA or DNA which code for a protein. They can be used in diagnostics, therapeutics (e.g. gene therapy) and as research reagents. The sequence presented is the phosphorothicate oligomucleotide

The present invention describes an oral pharmaceutical formulation (I) for delivering a bioreactive macromolecule to a mucosal surface. (I) comprises a first population of carrier particles comprising drug and a bioadhesive compound; and a second population of carrier particles comprising a penetration enhancer. Also described is a method for enhancing the mucosal absorption of the bioactive macromolecule in a mammal (preferably a human) by mucosally administering (I). (I) has antiuleer, antiinflammatory, antirheumatic, antiarthritic and cytostatic activities. (I) can be used for delivering a bioreactive macromolecule to a mucosal surface. It is used for the oral delivery of a drug to an annimal encompassing a human as well as other mammals, reptiles, fish, amphibians and birds. It is used to deliver drugs including peptides, proteins, monoclonal antibodies their fragments, nucleic acids (DNA and

The invention relates to an isolated glycoprotein hormone Zlut1 sequence, the mature protein or antigenic peptides derived from Zlut1. Also included are an isolated polynuclectide encoding Zlut1, an isolated antibody that specifically binds to Zlut1, treating hyperthyroidism in female mammals by administering Zlut1 and a pharmacentical composition comprising Zlut1. Zlut1 is useful for manufacturing a medicament for treating hyperthyroidism. Anti-Zlut1 antibodies can be used to detect Zlut1 in tissue sections from a biopsy specimen or to screen biological samples in vitro for the presence of Zlut1. Zlut1 is useful for treating women with hyperthyroidism. The nucleic acid molecules are useful for detecting the expression of a Zlut1 gene in a biological sample. The use as a probe for detecting Zlut1 genemic DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                  New Zlutl polypeptides and polynucleotides, useful for manufacturing medicament for treating hyperthyroidism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Human IE-2 antisense oligonucleotide

```
The invention relates to a novel compound comprising an optionally stabilised nucleic acid or its analogue encoding a peptide, protein or other blological modifier, aptemer, antisense sequence, or antisense confortal modifier, aptemer, antisense sequence, or antisense compound a linker to a ligand for the cranscobalamin receptor or intrinsic factor receptor. A compound of the invention has cytostatic, antiviral, anti-HIV, hepatotropic, antinflammatory, virucide, tuberculostatic, and protozoacide activity. The compounds may be useful in the manufacture of a medicament for the and modulates a blological process, in medical therapy A compound is also useful for treating cancer, viral diseases such as infection caused by HIV, hepatitis (hepatitis B, hepatitis C and hepatitis D), herpes, TB, Epstein-Barr virus, malaria, influenza virus, para influenza virus, mumps virus, adenoviruses, recoviruses, respiratory syncytial virus, entroviruses, polioviruses, respiratory syncytial virus, reprire contentitis viruses, recoviruses, rubella virus, contentitis viruses, rubella viruses, rubella virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          molluseum vontagiosum virus, human parvovirus B19, cytomegalovirus, human papillomavirus, varicella zoster, arenaviruses or filoviruses. The present sequence is used in the exemplification of the invention

The invention relates to a novel compound comprising an optionally stabilised nucleic acid or its analogue encoding a peptide, protein or other biological modifier, aparamer, antisense sequence, or antisense mimic conjugated directly or through a linker to a ligand for the transcobalamin receptor or intrinsic factor receptor. A compound of the invention has extostatic, anti-viral, anti-HIV, hepatotropic, antiinflammatory, virucide, tuberculostatic, and protozoacide activity. The compounds may be useful in the manufacture of a medicament for the call control of an encountry of material that affects gene translation or gene transcription and modulates a biological process, in medical therapy. A compound is also useful for treating cancer, viral diseases such as infection caused by HIV, hepatitis (hepatitis S), hepatitis C and hepatitis D), herpes, TB, Epstein-Barr virus, malaria, influenza virus, para influenza virus, adenoviruses, reoviruses, reoxiruses, coxsackie-viruses, echoviruses, rubella virus, enteroviruses, gastroenteritis viruses, rubella viruses, molluseum vontagiosum virus, human parvovirus B19, cytomegalovirus, human parvovirus B19, cytomegalovirus, papillomavirus, varicella zoster, arenaviruses, of the virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neuroprotective, vasotropic, gastrointestinal; immunological; cytostatic; GPCR binding modulation; ligand; GPCR; G protein-coupled receptor; binding, central nervous system disorder; circulatory disorder; cancer; digestive disorder; immune system disorder; metabolic disease; human; TGR23-2 ligand; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid, aptamer, antisense sequence, or antisense mimic conjugated to a ligand for the transcobalamin receptor or intrinsic factor receptor.
                                                                                                                                                                                                                                                                                                                                                                      Compound useful for treating e.g. cancer comprises optionally stabilized
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         papillomavirus, varicella zoster, arenaviruses or filoviruses. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 15.2; DB 1; Length 21; Pred. No. 6e+02;

                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for presuming a binding molecule e.g. ligand of a protein with unknown ligand comprises: (a) obtaining classification data of proteins with known ligands based on the amino acid sequences wherein the alignments of such known ligands correspond respectively to the ligands or ligand types; (b) using the classification data to provide ligand-determining residue-ligand classification data that show the co-relationships among ligand-determining residues and ligands or ligand types to thereby obtaining the alignments of proteins with unknown ligands for specifying 1 or more ligand-determining residue positions; (c) applying the data at least concerning the ligand-determining residue-ligand classification data; and (d) estimating residue-ligand classification data; and (d) estimating the ligand or its type of the protein with the unknown ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ligands can have neuroprotective, vasotropic, gastrointestinal, immunological and cytostatic activities, and can be used for modulating g protein-coupled receptor (GPCR) binding. The method can be used for ogpore estimating and presuming ligands or their types directly binding e.g. to GPCR from sequence data, applicable in identifying proteins and analysis of their functions, and in drug development for preventing or treating diseases of the central nervous system, circulatory, disestive and immune systems, cancer, and metabolic diseases. The present sequence represents a PCR primer for human TGR23-2 ligand, which is used in an example from
                                                                                                                                                                                                                                                                                                          Computer-based method for estimating and presuming ligands or their types
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antiviral screening; immunoassay; ss; nuclease inhibitor; gene therapy; AIDS; bacterial infection; viral infection; protozoan infection; abnormal cell proliferation; tumour formation; atherosclerosis.

with RNA or DNA, comprising covalently-bound nucleosides that individually include a ribose of deoxyribose sugar portion and a base portion. The nuclease resistant compounds are useful as therapeutics, diagnostic agents, or research reagents. The compounds are also useful for modulating the activity of an RNA or DNA molecule, or for treating an organism with a disease associated with the undesired production of a protein, e.g. bacterial, viral or protozon infections, AIDS, abnormal cell proliferation and tumour formation, or atherosclerosis. The present sequence represents the antiviral screening immunoassay oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nuclease resistant compounds, useful as therapeutics, diagnostic agents, or research reagents, or for treating an organism with a disease associated with the undesired production of a protein, e.g. bacterial infections or AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a nuclease resistant compound that hybridises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The invention relates to a nuclease resistant compound that hybridises with RNA or DNA, comprising covalently-bound nucleosides that individually include a ribose of deoxyribose sugar portion and a base portion. The nuclease resistant compounds are useful as therapeutics, diagnostic agents, or research reagents. The compounds are also useful for modulating the activity of an RNA or DNA molecule, or for treating an organism with a disease associated with the undesired production of a protein, e.g. bacterial, viral or protozon infections, AIDS, abnormal cell proliferation and tumour formation, or atherosclarosis. The present sequence represents the antiviral screening immunoassay oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           wew nuclease resistant compounds, useful as therapeutics, diagnostic agents, or research reagents, or for treating an organism with a disease associated with the undesized production of a protein, e.g. bacterial infections or AIDS.

The present invention relates to a cobalamin-bound detectable or therapeutic agent in combination with a cobalamin transport protein. In the manufacture of a medicament to increase the uptake of detectable agent useful in radioimaging or therapeutic agent for treatment of a disorder associated with abnormal cellular proliferation, an infectious disease and cardiovascular disorder; as an antibiotic or antiviral agent; for transcription of al factor. The method increases efficiency of vitamin B12 or vitamin B12 conjugated materials. The presents sequence trepresents an antisense nucleotide that can be conjugated to the carriers
                                                                                             Antisense DNA #14 that can be conjugated to the carriers of invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense DNA #1 that can be conjugated to the carriers of invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                Composition useful for the treatment of e.g. infectious disease, comprises a cobalamin-bound detectable or therapeutic agent in combination with a cobalamin transport protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

The invention relates to formulations and methods which enhance the local and systemic uptake and delivery of oligomuclectides and nucleic acids via non-parenteral routes of administration. The formulation is used for treating inflammatory bowel disease, e.g. ulcerative colitis, Crohn's disease or inflammatory bowel disease, in animals (e.g. human). It can slace be used for treating undue cellular proliferation. The present sequence is an antisense oligomuclectide targetted against Human cytomegalovirus (HCWV) gene. This sequence is used to illustrate the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ÷
                                                                                                                                                                                                                                                                                                                        The present invention relates to a cobalamin-bound detectable or therapeutic agent in combination with a cobalamin transport protein. In the manufacture of a medicament to increase the uptake of detectable agent useful in radioinaging or therapeutic agent for treatment of a disorder associated with abnormal cellular proliferation, an infectious disease and cardiovascular disorder; as an antibiotic or antiviral agent; for transcription of al factor, the method increases efficiency of vitamin B12 or vitamin B12 conjugated materials. The presents sequence represents an antisense nucleotide that can be conjugated to the carriers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human cytomegalovirus (HCMV) gene specific antisense oligo, ISIS 2922

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to formulations and methods which enhance the local and systemaic uptake and delivery of oligonucleotides and nucleic acids via non-parenteral routes of administration. The formulation is used for treating inflammatory bowel disorders, e.g. ulcerative colitis, Crohn's disease or inflammatory bowel disease, in animals (e.g. human). It can also be used for treating undue cellular proliferation. The present sequence is an antisense oligonucleotide used to illustrate the method of

The invention relates to a modified oligonucleotide comprising several covalently bound nucleosides including a ribose or deoxyribose sugar portion and a base portion. The nucleosides are joined together by internucleoside linkages such that the base portion of the nucleosides for internucleoside linkages such that the base portion of the nucleosides of internucleoside linkages such that the base portion of the nucleosides includes a modified ribofuranosyl moiety bearing a '-fluoro substituent. The antisense oligonucleotides of the invention are useful as therapeutics, diagnostics and research agents e.g. for the treatment of various viruses (e.g. AIDS), for modulating the production of proteins by an organism, treating an organism having a disease involving an undesired production of a protein (e.g. atherosclerosis, cancer), detecting the presence or abnormal RNA molecules, in organisms or cells, and for the expression of normal RNA molecules, or abnormal or imappropriate expression of normal RNA molecules, or abnormal or inappropriate capens: The compounds have improved stability to enzymatic degradation with various intracellular and extracellular nucleases, and improved ability to bind to a specific DNA or RNA with fidelity compared to wild-bNA bNA bNA bNA and RNA-DNA dupleases containing methylphosphonates, phosphoramidates and phosphorace triesters. The present sequence is an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò

                                                                                                                                                                                                  misc_RNA
   The invention relates to a nuclease resistant mixed sequence oligonucleotides comprising at least one modified 2' deoxyfuranosyl group. The modified oligonucleotides are disclosed as being useful for modulating the production of a protein by an organism, and especially for treating a disease in an organism which is characterised by the undesired production of a protein. The oligonucleotides may be used to treat diseases caused by viruses or other agents. The oligonucleotides may also be used for diagnostic methods for detecting the presence or absence of abnormal RNA molecules in an organism or cell. Oligonucleotides of the invention that selectively bind RNA may also be useful as research reagents. The new oligonucleotides are nuclease resistant and hybridise to RNA or DNA targets with high strength and specificity. The present sequence represents an antiviral screening antisense oligonucleotide.
                                                                             /*tag= b

The invention relates to a nuclease resistant mixed sequence oligonucleotides comprising at least one modified 2'-deoxyfuranosyl group. The modified oligonucleotides are disclosed as being useful for modulating the production of a protein by an organism, and especially for treating a disease in an organism which is characterised by the undesired production of a protein. The oligonucleotides may be used to treat diseases caused by viruses or other agents. The oligonucleotides may also be used for diagnostic methods for detecting the presence or absence of abnormal RNA molecules, or for detecting the inappropriate expression of normal RNA molecules in an organism or cell. Oligonucleotides of the invention that selectively bind RNA may also be useful as research reagents. The new oligonucleotides are nuclease resistant and hybridise to RNA or DNA targets with high strength and specificity. The present sequence represents an antiviral screening antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

The present invention describes a delayed release oral formulation (A), giving enhanced gastrointestinal (GI) absorption of a drug (I). (A) enhances a first set of particles containing (I) and a penetration enhancer (II) and a second set of particles containing (II) in a delayed release coating or matrix (III). (A) is used for enhancing the absorption of (I) in mammals, especially humans. Typical disorders to be treated include ulcerative collifis, rheumancoid arthritis, Crohn's disease, inflammatory bowel disease and abnormal cellular proliferation. When the particles release (I) and (II) at a first location in the GI tract elease pulse) and is often present in insufficient amount to promote absorption of the entire dose of (I). This problem is solved by providing further (II) in delayed release form in the particles, so that absorption
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (I) is completed in a second pulse. The present sequence represents an emplary oligonuclectide from the present invention which inhibits HCMV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             G protein-coupled receptor; GPCR; TGR23-2; TGR23-1; TGR23; anorectic; cytostatic; obesity disorder; cancer; appetite stimulation; PCR primer;
                                                                                                                                                                                                                                                                                                                            Pulsed release oral formulation providing enhanced gastrointestinal absorption, comprises first particles containing drug and penetration enhancer and second particles containing delayed release penetration

                                                                                                                                                                                                                                                                                                                                              0
                                                                                                                                                                                    invention describes polypeptides (I) and their amides, esters
                                                                                                                                                                                            and salts which bind to the human G protein. Coupled receptor (GPCR) proteins TGR23-1 and TGR23-2. TGR23 proteins have anorectic and cytostatic activities. (I) can be used in the treatment, prevention and diagnosis of obesity disorders and cancer (including cancer of the intestines, colon, breast, lung (including non-small cell lung cancer), prostate, oesophagus, stomach, liver, pancreas, kidney, womb, ovary, testis, bladder and brain, and blood cancers). (I) can also be used in appetite stimulation. Acc68807 to Acc68800 and ABP97281 to ABP97280 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   G protein-coupled receptor; GPCR; TGR23-2; TGR23-1; TGR23; anorectic; cytostatic; obesity disorder; cancer; appetite stimulation; PCR primer;
                                                                                                                                  Polypeptides binding to G-protein coupled receptors TGR23-1 and TGR23-2 for prevention and treatment of obesity, cancer and appetite disorders.

                                                                                                                                                                                     The present invention describes polypeptides (1) and their amides, esters and salts which bind to the human G protein-coupled receptor (GPCR) proteins TGR23-1 and TGR23-2. TGR23 proteins have anorectic and cytostatic activities. (1) can be used in the treatment, prevention and diagnosis of obesity disorders and cancer (including cancer of the intestines, colon, breast, lung (including non-small cell lung cancer), prostate, oesophagus, stomach, liver, pancreas, kidney, womb, ovary, testis, bladder and brain, and blood cancers). (1) can also be used in appetite stimulation. ACC68807 to ACC68890 and ABP97241 to ABP97280 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mutant Fab fragment of anti-CD4 antibody 13B8.2, useful for treatment or prevention of e.g. autoimmune diseases, transplant rejection, cancer and viral infection, binds to CD4 receptor.
Polypeptides binding to G-protein coupled receptors TGR23-1 and TGR23-2 for prevention and treatment of obesity, cancer and appetite disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel mutant Fab fragment (A) of the anti-CD4 antibody 1388.2 that binds to CD4 and has a mutation of at least one residue in the variable domain (Vh) of the heavy chain and/or in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               anti-CD4; 13B8; 2; Fab fragment; CD4; immunosuppressive; antirheumatic; antiarthritic; antipsoriatic; dermatological; antinflammatory; cytostatic; virucide; anti-HIV; autoimmune disease; rheumatoid polyarthrits; psoriasis; lupus erythromatosus; immunological intolerance reaction; transplantation; graft versus host disease; cancer; immunodeficiency; HIV; PCR; primer;

The present invention relates to a method for deprotection of phosphorus-protected oligonucleotides. The method involves contacting the phosphorus reprotected oligonucleotide with non-malodorous deprotecting agent to remove the phosphorous protecting group (which is optionally substituted alkyl). The method is useful for the preparation of phosphorus protected oligonucleotides, which is useful for the preparation of phosphorus protected compound. The present sequence is an oligonucleotide, used to illustrate the method of the invention.
           has immunosuppressive, antirhematic, antiatthritic, antipsoriatic, dermatological, antiinflammatory, cytostatic, virucide, and anti-HIV activity. A mutant fragment of the invention is useful for treating and preventing autoimmune diseases, specifically rheumatoid polyarthritis, psoriasis or lupus erythromatosus; immunological intolerance reaction, especially where induced by transplantation or graft versus host disease; cancers in which CD4 is implicated (especially CD4+ or Cesari lymphoma); and immunodeficiency states associated with viral infection, especially HIV. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        preparation of pharmaceutical compound involves contacting the phosphorus protected oligonucleotide with non-malodorous deprotecting agent.
domain (Vkappa) of the light chain. A protein of the invention

This invention relates to novel compositions that comprise short

interfering RNA (siRNA) molecules, which can be used to inhibit

cangiogenseis. Specifically, it refers to siRNAs that target and cause
RNAi-induced degradation of mRNA item human vascular endothelial growth

factor (VBGF), the VBGF receptor (Flt-1) and the Flk-1/KDR (kinase domain

cergion) genes, as well sa mutants derived thereof. The present invention

describes sense and antisense RNA strands that form an RNA duplex and

child to the target mRNA, such that expression is inhibited and the target

ce degraded. As such, siRNA administered in combination with a therapeutic

ce agent is useful for treating diseases associated with anglogenesis and

the overexpression of VEGF, which include diabetic retinopathy, age-

ce theumatoid arthritis. Furthermore, it can be used to treat various

crancers including breast, retinoblastoma, Wilm's tumour and lymphoma.

CC Accordingly, these compositions exhibit cytostatic, antidiabetic

cophthalmological, antiinflammatory, antipsoriatic, antidiabetic

antiathritic activities. This oligonucleotide is a human Flk-1/KDR DNA

collgo, a target for siRNA inhibition of the invention.
                                                                                                                                                                                                                                                            human; ss; short interfering RNA; siRNA; angiogenesis; vascular endothelial growth factor; VEGF, VEGF receptor; Flt-1; Flk-1/KDR; kinase domain region; diabetic retinopathy; age-related macular degeneration; inflammatory disease; psoriasis; rheumatoid arthritis; cancer; breast; retinoblastoma; wilm's tumour; lymphoma; cytostatic; antidiabetic; ophthalmological; antiinflammatory; antipsoriatic; antirheumatic; antiarthritic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel short interfering RNA (siRNA) comprises sense and antisense RNA strands, useful for inhibiting expression of human vascular endothelial growth factor mRNA, for treating angiogenic disease, e.g. diabetic

The invention relates to phosphorothioate oligonucleotides having nucleoside with 240 modification are prepared by phosphitylating 5'-hydroxyl of a nucleic acid moiety having a nucleoside with 2' modification in an acetonitrile containing solvent mixture to form a phosphite intermediate; and oxidising the phosphite intermediate with an acetyl disnlifide in an acetonitrile for a time to effect conversion of the phosphite intermediate to phosphorothioate. The invented method achieves high yields and greater efficiency. The present sequence is sulphurised oligonucleotide used in the exemplification of the invention.
                                                                             Phosphorothioate backbone; sulphurised oligonucleotide; RNA-DNA hybrid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preparation of phosphorothioate oligonucleotides involves oxidizing phosphite intermediate with acetyl disulfide in acetonitrile for time effect conversion of phosphite intermediate to phosphorothioate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0.9%; Score 15.2; DB 1; Length 21; 85.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to phosphorothioate oligonucleotides having nucleoside with 240 modification are prepared by phosphitylating 5'-hydroxyl of a nucleic acid moiety having a nucleoside with 2' modification in an acetonitrile containing solvent mixture to form a phosphite intermediate; and oxidising the phosphite intermediate with an acetyl disulfide in an acetonitrile for a time to effect conversion of the phosphite intermediate to phosphorothioate. The invented method achieves high yields and greater efficiency. The present sequence is sulphurised oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preparation of phosphorothioate oligonucleotides involves oxidizing phosphite intermediate with acetyl disulfide in acetonitrile for time to effect conversion of phosphite intermediate to phosphorothioate.

The invention relates to a method for treatment of infection by alphaherpesviridae, beta-herpesviridae or gamma-herpesviridae involving administration of an arylnaphthalene compound. The method is used for treating infection by beta-herpesviridae (preferably herpesvirus 5, 6 o 7), gamma-herpesviridae (preferably herpesvirus 4 or 8) and alphaherpesviridae (preferably herpesvirus 1, 2 or 3). The arylnaphthalene compound inhibits virus growth. This sequence represents a phosphorothioate oligonucleotide used to treat herpesviridae infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of arylnaphthalene compound for treating infection by herpesvirus e.g. alpha herpesvirinae, beta herpesvirinae and gamma herpesvirinae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human heat shock protein 27 antisense oligonucleotide SEQ ID NO:2

                                                                                                                                                                                                                                                                        The present invention describes a composition which comprises a therapeutic agent that reduces the amount of active heat shock protein 27 (hsp27) in hsp27 expressing cells exposed to the therapeutic agent. The composition has cytostatic activity, and can be used in gene therapy. The composition is useful in treating cancer, e.g., prostate, bladder, lung, breast, pancreatic, colon, skin (for example melanoma), renal or ovarian cancer or a central nervous system malignancy. The present sequence represents a human hsp27 antisense oligonucleotide which is used in the exemplification of the present invention.
                                                                                                                                                                New composition comprising a therapeutic agent that reduces the amount of active hsp27 in hsp27 expressing cells exposed to the therapeutic agent, useful in treating cancer, e.g., prostate cancer or a central nervous system malignancy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Formulation useful for treating, controlling or preventing prion disease or for prophylactic treatment of cancer caused by oncoviruses, comprises an antiviral oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to an antiviral oligonucleotide formulation

comprising an antiviral oligonucleotide, where the antiviral activity of

the oligonucleotide occurs principally by a non-sequence complementary

mode of action. Further disclosed is a kit comprising at least one

antiviral oligonucleotide or antiviral oligonucleotide formulation in a

labelled package, where the label on the package indicates that the

antiviral oligonucleotide can be used against at least one virus, and a

method for the prophylactic treatment of cancer caused by oncoviruses in

tuman or non-human animal. The formulations and antiviral pharmaceutical

composition are useful in the treatment, control, or prevention of a

composition are useful in the treatment of cancer caused by oncoviruses in

useful for the prophylactic treatment of cancer caused by oncoviruses in

a human or a non-human animal, or viral infections. The current sequence

represents an oligonucleotide used in an example from the invention.

New variant of the Yin Yang-1 transcription factor, useful for treating e.g. diabetes and autoimmune disease, also for diagnosing predisposition and in screening for therapeutic agents.

Disclosure; Fig 11; 193pp; German.

The invention describes a protein variant of the Yin Yang-1 transcription factor (I), having a 411 amino acid (aa) sequence (4) reproduced. Also described are: protein (Ia) that is a homologue of (4) and includes Arg a position 303 and Lys at position 31; peptide (II) that is a fragment of (I) or (Ia) and includes the positions 303 and 311 of (4); nucleic acid (II) that encodes (I), (Ia) or (II); an antibody (Ab) directed against (I) or (Ia); methods for determining a tendency to develop type 1

diabetes, transgenic non-human mammal (A) in which the germ and somatic cells contain a nucleic acid (or segment) encoding a 411 as sequence (2), or sequences with at least 95, best 93* homology, where the homologue includes 303Met and 311Mrg; and use of (A) to screen for compounds that are protective against diabetes. The methods are useful for modulating activity of the Y1 (Yin Yang-1) multifunctional transcription factor. (I), or its homologues and peptides, also nucleic acids encoding them and antisense oligonucleotides, are useful for treatment of type 1 lipid metabolism. Detecting mutations in the human analogue of (4) is used to determine a predisposition for these diseases. Transgenic animals that contain the sequence encoding (4), or its homologues, are used to escreen for against diabetes. This sequence represents a primar associated with the isolation and analysis of yin yang-1 transcription factor.

for IL-2 receptor useful for treating carcinoma expressing IL-2 receptor Humanised antibody comprising - CDR region of mouse MAB B-B10 specific

Disclosure; Page 44; 62pp; English.

The sequences given in AAQ43226-32 are primers which were used in the cloning of DNA encoding the variable (V) regions of the murine anti-human IL-2 receptor monoclonal Ab (MAb) B-B10. This MAb was used in the construction of a humanised antibody (Ab) which binds specifically to human interleukin (IL)-2 receptor (AIL2R). The complementarity-determining regions (CDRs) for the hIL2R MAb were derived from B-B10 (see

This sequence is an analogue of an antisense sequence to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /noce= "2'-0-[hexyl-N-(3-oxycarbonyl-cholesteryl)amino]-
uridine or may be 5'-0-dimethoxyrrityl-2'-0- [hexyl-N-(5-
thiocarbonyl-3,6-dipivolyl fluorescein)amino]uridine"
also AAR37599-04). The hIL2R MAb is antagonistic to the binding of IL-2 to the IL-2 receptor on human T-cells. It also inhibits the human mixed lymphocyte reaction. The cDNA encoding the variable (V) region of the B-B10 Ab was cloned by PCR and sequenced (see also AQ431233-36) A human Ab with high levels of amino acid sequence homology to the murine sequence was selected and the framework of this Ab was bound with the B-B10 V region CDR and a part of the framework to design several kinds of the humanised B-B10 V region. The DNA sequence coding this humanised B-B10 was synthesised and a plasmid expressing humanised B-B10 was constructed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New amine-derivatised nucleoside(s) and oligo:nucleoside(s) - useful as diagnostics, therapeutics and research reagents, partic. in anti-sense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alkylamino group; ribofuranosyl sugar; antisense therapy; virus; HIV;

cytomegalovirus (CMV) sequence. The modified nucleosides may increase the half-life of the oligomers in cell extract assays for the inhibition of specific target sequences. The modified oligomer is an example of a compound (see AAQST99-Q85839 for other examples) e.g. a nucleoside or oligonucleoside, which contains a ribofuranosyl sugar portion and a base portion, such that at least one of the nucleoside contains at a 2'-0', 3' o' o s'-0-position, a substitution (see AAQSS799 for details of the substitutions). The compounds are useful in diagnostics, therapeutics and as research reagents particularly in antisense therapy for killing calls and viruses such as HIV, herpes or papilloma viruses. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This oligonuclectide was used to generate a fusion protein in which the sea firefly (Vargula sp.) luciferase is linked to an epidermal growth factor receptor, via a mouse immunoglobulin (1g) constant heavy domain 4 (CH4) chain. This oligonuclectide was used to construct the CH4 linker. This is an example of a method of detectably labelling cells by fusing a secretory-type luminescent enzyme with a cell membrane protein and expressing the fusion protein on the cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sea firefly, Vargula; luciferase; label; mouse; immunoglobulin; murine; constant heavy domain; epidermal growth factor receptor; fusion protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A method of labelling cells - comprising a luminescent protein fused to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to nucleic acids encoding NOVX (X being an integer from 1-8) polypeptides. The NOVX nucleic acids and polypeptides are useful in diagnosting, treating or manufacturing a medicament for a disease or disorder associated with NOVX e.g. cell proliferation (cancer and diabetic retinopathy), angiogenic or pulmonary disorders, fertility inflammatory and tumour related disorders, emphysema, cirrhosis, wound healing. NOVX nucleic acids are also useful in gene therapy. They are also used for screening for a modulator of activity or of latency or predisposition to a NOVX-associated disorder. They are also useful for determining the presence of or predisposition to a NOVX-associated disorder. They associated disorder. They associated disorder. They associated disorder. They are also useful for disorder. The presence of or predisposition to a NOVX-associated disorder. They associated disorder. They are also useful for disorder. The presence is an RTO PCR primer (real-time quantitative PCR) for amplifying nucleic acids encoding human NOV2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.9%; Score 15.2; DB 1; Length 22; 85.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel isolated G-protein coupled receptor (GPCR) polypeptides and polynucleotides. The GPCR polypeptide, GPCR nucleic acid and antibody are useful for treating, preventing or alleviating a GPCR-associated disorder or a pathological state in a subject, particularly a human. In particular, the disorder is cardiomyopathy, atherosclerosis, diabetes, or a disorder related to cell signal processing and metabolic pathway modulation. The GPCR polypeptide and nucleic acid are also useful for diagnosing the presence of or predisposition to a disease associated with altered levels of GPCR, particularly cancer. The GPCR nucleic acid amplications for disorders associated with aberrant GPCR expression or activity. The DNA encoding the protein is useful in gene therapy for treating the above conditions. Furthermore, the nucleic acids and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Edinger S;
Gunther E;

polypeptides are useful in treating adenocarcinoma, lymphoma, prostate cancer, uterus cancer, immune response, neurodegenerative disorders, asthma, inflammatory disorders, Crohn's disease, multiple sclerosis or Albright hereditary osteodystrophy. These are also useful in developing a powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. ABS58747-ABS59231 represent human GPCR coding sequences, primers and probes of the invention

New NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders e.g. diabetes, cancer, Alzheimer's disease, dyslipidemias, obesity, immune or hematopoietic disorders, and asthma.

Example C; Page 505; 619pp; English.

The present invention relates to new isolated proteins (NOVX) and their coding sequences (ABV99127-ABV99595 and ABP70049-ABP70149), where X is any number from 1 to 48. The NOVX proteins and coding sequences are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The NOVX coding sequences and proteins are useful for treating, preventing or diagnosing diseases, uncreasing an estabolic disorders, concer, neurodegenerative diseases, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, cardiovascular disorders, fertility, bronchial asthma, AIDS, dyslipidemia, metabolic disturbances associated with obesity, metabolic syndrome X or wasting disorders associated with chronic diseases or various cancers. The NOVX coding sequences and proteins may also be used as targets for the identification of small molecules that modulate or inhibit e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                        0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an agent for modifying the C-terminal of a protein comprising an acceptor region with a group capable of binding to a protein through a transpeptidation reaction in a protein translation system, and a modifying region containing a non-radioactive modifier linked to a part of the acceptor region via a nucleotide linker. The modified proteins are useful for detecting protein interaction in functional analysis of genes e.g. in genome projects, as well as protein-nucleic acid interaction in large quantities in high-throughput screenin-when studying biological molecules such as proteins and mucleic acids in genome function or proteome analysis. The modified proteins can be conveniently and quickly applied in studying protein interactions, with improved efficiency. ARK95189-ABK95225 represent PCR primers used in
 wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The present sequence is a PCR primer, which was used in an example from the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: These oligonucleotides may have one or more of several modifications which are detailed in the specification, including having a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modulating the expression of a nucleic acid in the hepatic system, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      for treating hepatic disorders, comprises administering to the mammal an oligonucleotide that hybridizes to the nucleic acid to modulate its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel method of modulating the expression of a nucleic acid in the hepatic system of a mammal which comprises administering to the mammal an oligonucleotide that hybridises to the nucleic acid to modulate the expression of the nucleic acid, where the oligonucleotide has two sterol groups that are covalently bonded. The invention may be useful for the development of a compound with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hepatotropic activity whilst the genetic sequences of the invention may prove useful for gene therapy. The methods are useful for treating hepatic disease or disorder associated with a protein encoded by a gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

enzyme gene and a gene encoding the ligninase so ligated that the gene can transcribe; preparing a host cell with the vector; and culturing such host cells. The promoter sequence of the cellulose-decomposing enzyme gene is particularly the promoter sequence of the callobiose endoyloranase I gene or beta-glucosidase gene. The DNA fragment for the ringhinase in basidiomycetous host is applicable in production of recombinant ligninase in host-vector system for use in processing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method for producing a ligninase comprising the construction of a vector from a recombinant DNA containing a DNA with a promoter sequence of a Basidiomycetes-derived cellulose-decomposing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     woodchips and pulp. This sequence corresponds to a primer to PCR amplify the genes and promoter fragments of the invention.

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, antoractaric, hypotensive, antistateriosclerotic, anorectic, cardiant, hypotensive, antistateriosclerotic, nootropic, controlated, antidiatement, osteopathic, antistarkinatory, dermatological, antistamatic, and antisological, antistamatic, and antisological artistary. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, contential, and protocoal), anorexta, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, altherimer's disease, parkinson's disease, epilepsy, immune disorders and polypeptides or sathma, and various dyslipidaemias. The nucleic acids and polypeptides for the identification of small molecules that modulate or inhibit e.g. neurogenesis, call differentiation, hamalogical, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NoVX substances for use in therapetic or diagnostic methods. The nucleic calcing and angiogenesis, in generation or anity prophesi, in probas, in chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NOVX polypeptides of the invention show homology to certain known human proteins: NOV1a-1t show homology to fibroblast growth factor receptor (FGFR4); NOV2a shows homology to complement factor I precursor; NOV3a shows homology to matrix metalloproteinase-15 precursor; NOV3a shows homology to matrix metalloproteinase-15 precursor; NOV4a-5c show homology to 1-lymphocyte surface antigen Ly-9 precursor; NOV6a-5c show homology to fibroblast growth factor-21 (FGF-21); NOV7a-7c show homology to fibroblast growth factor-21 polypeptide variant; NOV8a-8g show homology to antileukoproteinase I precursor; NOV9a-9i show homology to antileukoproteinase I precursor; NOV9a-9i show homology to LIV-1 protein; NOV10a shows homology to nuclear hormone receptor NOR-1; NOV11a-11j show homology to

The invention relates to identifying a compound comprising exposing cell expressing gene 1 having enhancing or suppression effect on an APPL-SV Denotype (a transgenic fruit fly expression the Amyloid precursor-like protein, APP, as a fusion protein with the suppressor of hairless transcription factor, Su(H) and V916 activation domain. The fusion correctly protein is clawed by gamma secretase (encoded by the Psn gene) to release the Su(H-VP16, which affects wing vein development. Genes affecting Psn expression/activity were screened by crossing the APP-SV correctly psn expression/activity were screened by crossing the APP-SV line with an EP P-element insertion library, and the DNA recovered from the appropriate EP strain and sequenced) chosen from AD000864, correctly appropriate and fruit fly genes affecting APP processing and their mammalian homologues, identifying modulation of Alzheimer's disease (AD) correctly associated with AD relative to cell in absence of agent. Also included are regulating AD (involves providing a subject with AD or CC symptoms of AD and an agent that changes the expression of a gene certailed above or changes the activity of a polypeptide having a sequence chosen from AD000865-AD001066, and treating the subject with the agent) cand a composition (comprising a nucleic acid encoding a polypeptide
                                                                                                                                                                       0
transmembrane protein-like; NOV12a-12c show homology to beta-necendorphin -dynorphin precursor. The present sequence represents a PCR primer used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying compound by exposing cell that expresses gene having enhancing or suppression effect on APPL-SV phenotype to agent, identifying modulation of Alzheimer's disease (AD), regulation of gene or

detailed above or an expression vector comprising the nucleic acid or a host cell comprising the expression vector or an antisense oligonucleotide that hybridises under stringent conditions to the nucleic acid or polypeptide or an antibody that specifically binds to the polypeptide. The method is useful for identifying compounds modulating symptom of Alzahmer's disease (AD), regulation of biological pathway associated with AD, or regulation of gene expression or protein function of gene or protein associated with AD. The nucleic acids and proteins are useful in drug screening and useful in screening and treating the subject having increased susceptibility to AD or symptoms of AD such as dementia, memory loss, language deterioration and impaired visuospatial skills. The present sequence is a PCR primer used to amplify fruit fly DNA flanking

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of identifying compounds that influence fat cell number or size comprising providing a cell that expresses a gene and an agent, exposing the cell to the agent and identifying fat cell number or size relative to cells not exposed to the agent. The method also comprises providing an expression vector and an agent, exposing the vector to the agent, detecting a change in expression of the gene relative to expression of the gene in an expression vector not exposed to the agent, treating a subject with the agent and identifying fat cell number or size in the subject. The agent comprises an antisense oligonucleotide. The subject comprises a mammal, preferably a human. The method also comprises providing a polypeptide and an agent, exposing the polypeptide to the agent, detecting binding of the agent to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying compounds that influence fat cell number or size for treating or preventing obesity or diabetes by exposing the cell to the agent and identifying fat cell number or size relative to cells not exposed to the

The invention relates to a method of targeting an antisense oligonucleotide to hepatic tissues involving conjugating the oligonucleotide to a cholesteryl moiety and administering the conjugate. The method is useful for targeting an antisense oligonucleotide to hepatic tissues to modulate the expression of a gene in the liver. The oligonucleotide is useful in diagnostics, therapeutics, as research reagents and kits, in pharmaceutical composition and for treating diseases produced by undesired production of proteins. The method provides lipophilic oligonucleotide conjugates with improved biostability and altered blodistribution in mammals. The present sequence represents a modified oligonucleotide used for NMR analysis.
                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Targeting an antisense oligonucleotide to hepatic tissues to modulate the expression of a gene in the liver involves conjugating the oligonucleotide to a cholesteryl moiety and administering the conjugate.
polypeptide or a change in an activity of the polypeptide, treating a subject with the agent and identifying fat cell number or size in the subject. The agent comprises an antibody. A method of regulating fat cell number or size comprises providing a subject containing fat cells and an agent that changes the expression of a gene, and treating the subject with the agent under conditions so that fat cell size or number in the subject is altered. The method is useful for identifying compounds that influence fat cell number or size, for preparing a composition for treating or preventing obesity or diabetes. This sequence represents a PCR primer used to amplify fly DNA used in the scope of the invention.
                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes a method for detecting an analyte in a sample. The method comprises: (a) providing detection probes being to labelled with a first reporter, where the detection probes are capable of binding to the analyte; (b) providing a solid support; (c) providing capture probes being bound or capable of binding to the solid support; (c) providing concentrating the analyte on the solid support; (d) contacting the sample of concentrating the detection probes, the solid support; (d) contacting the detection probes where (i) the detection probes; and (e) detecting the detection probes where (i) the detection of detection probes in the presence of quenching probes binding to surplus detection probes on to being bound to the analyte and thereby contacted in the presence of quenching probes binding to surplus detection probes; and/or (ii) the solid support is labelled with capture detection probes, and/or (ii) the solid support is labelled with capture a second reporter different from the first reporter; imaging the sample of at an emission wavelength of the second reporter and applying this mask to an image of the sample used for reporter and applying this mask to an image of the sample actual capture

Six Candida genes have been isolated, which encode an apparent CDC25 phosphatase (TYP1), a p13suc1 homolog (CKS1), a cyclin dependent kinase (CDK-11), a CYCLIN (CDR-1), a CDK-activating kinase catalytic subunit (CDK-11), and a Map kinase (CMK1) (AAT64446 to AAT64451). The TYP1 (MOC1), and a Map kinase (CMK1) (AAT644464). The TYP1 is at least 75% to homologous to the amino acid sequence given in Seq 2, according to the claims of the specification. According to the disclosure, Seq 2 encodes CKS1 (AAT64446) and Seq 1 encodes TYP1 (AAT64447). The products may be used in reagents and assays which permit the rapid detection and cavaluation of Candida yeast infections and for identifying cpds. which have antifungal properties and which may be used as anti-mycotic agents. Such agents can be used therapeutically, as well as, for example, such agents in foodstuff, feed supplement for promoting weight gain in livestock, or in disinfectant formulations for treatment of non-living matter, e.g. for decontaminating hospital equiment and rooms

The present sequence is a primer for the cDNA encoding a haematopoietic cytokine receptor Zcytorl, useful for ligand detection, and pathological condition diagnosis, including cancer. Receptor agonists of the protein can be used to stimulate the proliferation and development of target cells in vitro and in vivo. The agonists can stimulate cell mediated immunity and lymphocyte proliferation, to treat infection involving immunosuppression, e.g. viral infections. They may also be used to suppress tumours, induce cytoxicity, treat leukopaenias and enhance the regeneration of the T-cell repertoire after bone marrow transplantation. Antagonists of the protein may be used to suppress the immune system, treat autoimmune diseases, including rheumatoid arthritis, multiple acclarosis and diabetes mellitis. Immune suppression caused by the antagonists can also be used to reduce rejection of tissue or organ transplants and grafts, and to treat T-cell specific leukaemias and

                                                                                                                                                                                                                                                   This invention describes a novel method for generating an antisense library targeted to a selected RNA transcript. The methods can be used for identifying antisense agents and for identifying target sites for antisense-mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed.

Germacrene A synthases plays a key role in the biosynthesis of seguiterpene lactones, catalysing the formation of a germacrane biosynthetic precursor from farmesyl diphosphate (FDP). Sesquiterpene lactones are bitter- flavoured plant products which provide resistance against insects, nematodes, microorganisms and vertebrate herbivores, and are also involved in plant-plant interactions. Nucleic acids encoding chicory germacrene A synthases A and B are useful for the production of transgenic plants with modified sesquiterpenoid synthase activity.
                                                                                                                                                                                                                                                                                                                 The present DNA sequence is the degenerate PCR primer-1, used to clone Candida cyclin dependent kinase, CDK1 gene. It is a cell cycle regulatory protein isolated from the genomic DNA of Candida albicans and was

            thus
Reduction of germacrene A synthase expression (e.g., via the use of antisense sequences) can be used to reduce bitter flavours in crops, thus increasing their commercial value. Increased germacrene A synthase expression may be used to obtain increased insect, nematode or microorganism resistance in plants, to obtain increased formation of segquiterpene lactones with desirable properties (e.g., medicinal properties), and to obtain increased formation of germacrene A-derived Indoor and fragrance compounds or phytoalexins. Sequences AAA97452.
A97453 represent PCR primers used in an exemplification of the invention to introduce restriction sites into the chicory germacrene A synthase A

sequence which activates transcription of human high affinity immunoglobulin (Ig)E receptor (FC-epsilonRI) alpha-chain gene. It may be used for inhibiting the activation of transcription relating to USF-1 or USF-2. The DNA contains the sequence tggggagcagctggggtaggaac, or cagctg. The invention is useful for the development of an agent for preventing and treating allergic diseases. The present sequence was annealed to its complementary sequence to generate the double stranded DNA sequence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

                                                                                                                                                                                                 The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in continuities by a primer designed based on the chromosome marker multiwell plates; (b) a primer designed based on the chromosome marker containing the corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell conferrination Nos. are maxed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the creanstituted as the positions on the chromosome and arrayed. The clones are reconstituted as the positions on the chromosome and arrayed. The crones are mixed for gene analysis.                                                                                                                                                                                  New transgenic mouse expressing an increased activity of enzyme 11-beta hydroxysteroid dehydrogenase 2 in its heart, useful as a model system for identifying and developing new drugs for treating cardiac dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a transgenic mouse which expresses an increased amount of enzyme activity of 11-beta hydroxysteroid dehydrogenase type 2 (11betaHSD2) in its heart relative to a non-transgenic isogenic mouse. The transgenic isogenic mouse is useful as a model system for identifying and developing new drugs for treating cardiac dysfunction. The present sequence is a PCR primer used in the creation of 11betaHSD2 mice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Poxicologically relevant gene; toxicological response; PCR primer;

described: (1) an array comprising one or more polynucleotides selected from the genes corresponding to the partial sequences given in ABZ82842 to ABZ84764, or their fragments of at least 20 nucleotides, or homologues; and (2) determining if a gene putatively identified to be a toxic response gene plays a role on toxic response pathways by determining the expression profile of the gene after exposure of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising: (a) exposing cells to an agent or isolating cells from a human subject who was exposed to an agent; (b) obtaining the test gene expression profile for a putatively identified toxic response gene after exposure to a known toxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of a gene with a similar function or exposure to other known toxic compounds. The methods are useful for predicting and determining toxicological responses on a cellular, organ to review the arrays comprising the human genes are useful for the review of the paramaceutical comparing the human genes are useful for the review of the paramaceutical comparising the human genes are useful for the review of the paramaceutical comparisor of the paramaceutical comparisor.

Achieving transient expression of at least an extracellular non-plant protein from a heterologous nucleotide sequence in moss protoplast comprises transiently introducing into the protoplast a heterologous nucleic acid construct.

Disclosure; Page 18; 49pp; English.

The specification describes a method for the production of extracellular non-plant protein from moss protoplasts. The method comprises transiently introducing into the protoplast a heterologous nucleotide sequence operably linked to a promorter. The heterologous nucleotide sequence encodes a protein selected from heterodimer, fusion antibody, immunoglobulin or single-chain antibody. The method is useful for protein production. PCR primers

```
The invention relates to a compound for silencing a gene comprising a single-stranded nucleic acid molecule having a 3' end, a 5' end and a cargeting region positioned between the 3' end and the 5' end, where the targeting region comprises a sequence trargeted to a target region in the cargeting region comprises a sequence trargeted to a target region in the center and the 3' end and the 5' end each comprise a sequence that enables the formation of a hairpin structure. Also included are a recombinant vector comprising a mucleic acid encoding the compound cited above, a chost cell comprising the mucleic acid mentioned above, an oligonucleotide having the structure H 2 - R 1 - H 1 (where R 1 is an oligonucleotide having the structure H 2 - R 1 - H 1 (where R 1 is an oligonucleotide consisting essentially of RNA or DNA of about 8-50 nucleotides configured to silence a substrate mucleic acid, and where H 1 and H 2 are oligonucleotides having sequences that enable the formation of a hairpin structure), a pharmaceutical composition for silencing agene (comprising a pane in a cell. The composition and method are useful for gene silencing purposes. RNA (e.g. siRNA) and DNA oligonucleotides are provided which are useful in silencing the RMP9 (not defined) gene targeting the F9 region. The present sequence is a multiple cloning site which is inserted into a vector, used to express libraries of antisense oligonucleotides which are vector.
                                                                                                                                                               ö
ADM32956-ADM32957 were used to amplify a 150 bp fragment of cDNA encoding
the N-terminal of a plant thaumatin-like To32 protein, in the course of
the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New sequence-specific oligonucleotide for silencing genes comprises a 3' end a 5' end and a targeting region positioned between the 3' end and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense obigonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] 2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the effects of psoriasis, oligonucleotide, which can be used to design the effects of psoriasis, rethyrosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancias, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperpoliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGFB]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AARASIS1 and AAFASIS3-F851G1). The method is useful for ameliorating the effects of psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB9]-2 or IGFB93), which is capable of inflammation or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, nearly antisense of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, nearly antisense of pso
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods for modulating the expression of PCTAIRE protein kinase 1 (also known as PCTAIRE-1, PTCK1 and crk5). The antisense oligonucleotide is useful for treating an animal having a disease or condition associated with PCTAIRE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein kinsel, particularly a hyperproliferative disease or a neurological disease. These diseases include thrombocytopaenia, mental neurological disease. These diseases include thrombocytopaenia, mental retardation, Wiskott-Adrich syndrome, retinitis pigmentosa, dystonia with Parkinsonism, sideroblastic anaemia X-linked Charcot-Marie-Tooth disease, or incontinentia pigmenti. The antisense oligonucleotide is particularly useful for inhibiting the expression of PCTAIRE protein kinase 1 in cells or tissues. It is useful for diagnostics, prophylaxis, or as research reagents or kits. The present sequence is human PCTAIRE protein kinase 1 DNA specific PCR primer. This sequence is used to illustrate the method of the invention
                                                                                                                                      New antisense oligonucleotides for modulating PCTAIRE protein kinase 1 gene expression, particularly useful for treating hyperproliferative or neurological disorders for example, mental retardation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

This is a human G-alpha-12 antisense nucleotide sequence. G-alpha-12 is a member of the G12/13 subfamily of G-proteins. The primary function of G-bipha-12 is in cell differentiation and growth. The invention relates to antisense compounds which are 8-30 nucleotides long (see AAZ57668-257746). The antisense molecules are targeted to the human G-alpha-12 molecules, and inhibit the expression of G-alpha-12. The molecules preferably have a modified internucleotide linkage, and at least one modified sugar moiety. The compounds target different regions of the human G-alpha-12 RNA. The expression of human G-alpha-12 is inhibited by contacting human cells or tissues in vitro with the artisense molecules. The oligonucleotides are used in modulating the function of nucleic acid molecules encoding G-alpha-12, ultimately modulating the amount of G-alpha-12 produced. The antisense compounds can be utilized for diagnostics, therapeutics, prophylaxis and as research agents and kits. They may be useful in the treatment of cancer, and

```
The invention relates to a novel isolated or purified nucleic acid. A polypeptide encoded by a nucleic acid of the invention has antibacterial activity, and may have a use in a vaccine. The nucleic acid is a TbD1 nucleic acid having a fully defined sequence of 3953 bp given in the specification. The TbD1 deletion or mmpL6 551 polymorphism is useful as a genetic marker for the differentiation of Mycobacterium strain of M. Copacition with at least one tuberculosis complex. The genetic marker is ablected from RD1, RD2, RD3, RD4, RD5, RD6, RD7, RD8, C genetic markers selected from RD1, RVD2, RVD3, RVD5, RVD5,
                                                                                                                                                               New TbD1 nucleic acids having the mutation CTG to CGG at codon 463 of gene katG, useful for distinguishing Mycobacterium tuberculosis infection from M. africanum, M. canetti, M. microti, M. bovis, or M. bovis BCG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ribozyme, hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.

                               The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1.

Representative examples of ribozyme recognition sites are given in AAA88415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a riboxyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP). cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (1). (1) can have antipsoriatic,
                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cell-cycle dependent kinase cdk2 ribozyme binding site SEQ ID NO:204.

dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (1) can be used in gene therapy. (1) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, virreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is one of 12 probes which differ only in the sequence at the TagI site in the wild-type c-Ha-ras corresponding to nucleotides 2508-2511. The "mutant" probes are used to detect the 12 possible base-pair mutations potentially induced by treatment of cells with the carcinogen ethylnitrosurea. (Updated on 25-MAR-2003 to correct PI field.)

RNA was extracted from genital lesions, reverse transcribed to produce CDNA and then the CDNA was used as the template for PCR amplification of various ortokines using the primers in AAT38964- AAT39005. To confirm the identity of amplified cDNA, digoxiganin-labelled probes specific for each cytokine (see AAT39006-T39021) were hybridised with Southern blots of amplified sequences. The expression profile for regressing and non-regressing warts was established and compared to cytokine expression carrents in normal cervical tissue. Results showed that interleukin 12 is barely expressed (if at all) in non-regressing warts, but is expression regressing warts. This suggests a central role for IL-12 in wart regression. It has been found that IL-12 can be used (especially as a vaccine adjuvant) for treating papilloma virus-associated lesions such as condyloma acuminata (anogenital warts) caused by human papilloma virus type 6 (HBV-6) and/Or HFV-11 and more generally for treatment of tumours associated with HPV16 and HPV18 infection e.g. anogenital, cutaneous,

                                                                                                                                                                                                                                                                       /noce= "This oligonucleotide has a phosphorothioate backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 5 nucleotides in length. Also all cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to antisense oligonucleotides (ADA66459-ADA66609), which inhibit Transforming Growth Factor (TGF) beta-3 expression. The oligonucleotides are useful for inhibiting the expression of TGF-beta3 in cells or tissues, and to treating an animal having a disease condition associated with TGF-beta3, e.g. a hyperproliferative disorder such as cancers of lung, liver, colon, oesophagus, pancreas, breast, skin or haematopoletic, atherosclerosis, rheumatoid arthritis,

Northern and Southern hybridisations were performed to determine the level at which IL-10 and IL-4 inhibit monokine production. The probe AAA03151 was used in Southern analysis of PCR products to detect IL-8 alpha coding sequences. The sequence of the probe corresponds to nucleotides 200-221 of the sequence given in Schmid et al., (1987), J. Immunol. It was found that IL-1 alpha, IL-6, TNF alpha, GM-CSF and G-CSF expression was strongly inhibited by IL-10 and IL-4 at the mRNA level. IL-1 beta and IL-8 expression was only slightly affected by IL-10.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Interleukin-10; IL-10; septic shock; bacterial infection; toxic shock; infectious shock; inflammation; immune response modulation; therapy; probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to antisense oligonucleotides (ADA66459-ADA66609), which inhibit Transforming Growth Factor (TGF) beta-3 expression. The oligonucleotides are useful for inhibiting the expression of TGF-beta3 in cells or tissues, and for treating an animal having a disease condition associated with TGF-beta3, e.g. a hyperproliferative disorder such as cancers of lung, liver, colon, oesophagus, pancreas, breast, skin or haematopietic, atherosclerosis, rheumatoid arthritis, preeclampsia and fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antisense compound which is targeted to nucleic acid encoding transforming growth factor beta-3, and inhibits expression of TGF-beta 3, useful for treating a condition associated with TGF-beta 3, e.g. cancer.
                                                                                                                                                                                                                                                                                                   /note= "This oligonucleotide has a phosphorothioate backbone and 2-"methyoxyethyl (2-MoB) wings at the 5' and 3' ends, which are 5 nucleotides in length. Also all cytidine residues are 5-methylcytidines"
                                                    SEQ ID 45.

The sequences given in AAQ43112-33 are primers which were used to amplify specific regions of the hepatitis C virus (HCV) genome. Analysis of regions of the HCV genome revealed the existance of three distinct groups of HCV. Analysis of the region encompassing -255 to -62 of the 5' non of HCV. Analysis of the region encompassing -255 to -62 of the 5' non of HCV analysis of the region encompassing -255 to of the 5' non nucleotide sequences between the three groups. Two of the groups indicatified were similar to those of HCV varients termed type 1 and 2, willst the third appeared to represent a novel type of virus. Comparison of the NS3 region (see AAR37927-30) showed a high degree of sequence diversity with type 3 being phylo- genetically different to type 1 and 2. The same degree different- lation was noted in the NS-5 (see AAR37931) between type 3 and type 1 sequences. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp.mRNA in specific human tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; primer; PCR; amplification; polymerase chain reaction; ss.

                                                                                                                                                                                                                                               This sequence represents a probe for a interleukin-10 (IL-10) coding sequence. The IL-10 protein can be used in the method of the invention to ameliorating a symptom of: (a) septic shock in a host suffering from a bacterial (preferably gram negative) infection; (b) toxic shock; (c) infectious shock; or (d) inflammation. The method comprises administering a biologically active IL-10 (preferably human) protein, malogue or a fragment (preferably full length). The treatment is used to modulate immune responses caused by the different shock syndromes, which are conditions are side-effects of microbial infections, caused by release of their protein products, especially on anti-microbial treatment, which when calls are killed, they layer releasing proteins which induce the shock conditions. IL-10 inhibits TNR-alpha (tumour necrosis factor-alpha) and TNF-gamma synthesis, which as part of an

Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T1901-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative

                                                    derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41227-8 amplify clone pm2231 which comprises the GS HUMGS001473 (T20473), located on chromosome 22
abundance of different mRNAs in the particular tissue from which it was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primers (AAT59707-11) were designed to test tobacco (Nicotiana tabacum cv. Samsun) plants for the presence of Bacillus thuringiensisderived Cryv (see also AAT597012) sequences following Agrobacterium-mediated transformation with vectors carrying novel constitutive or inducible gene expression cassettes. (AAT59705)/CRY1A2R (AAT59706) and CRYIA1 (AAT59707)/NOS (AAT59708), constitutive Cryv expression with TMVI/CRYVIR (AAT59709) and CRYVI (AAT59709) and cRYVI (AAT59709) and cRYVI (AAT59709) and inducible Cryla(c) expression with AACRI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chemically inducible expression cassette - contains inducible promoter activated by alcR regulator in presence of alcohol or ketone inducer, used for insecticide production in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
